1 Pseudocode

Algorithm 1 is Euclid's method, set with line numbers in the `ruled` float that the `algorithm` package declares.

Algorithm 1 Euclid's algorithm

Require: integers $a \geq 0$ and $b \geq 0$
Ensure: the greatest common divisor of a and b

```
1: procedure EUCLID(a, b)                    ▷ The g.c.d. of a and b
2:     r ← a mod b
3:     while r ≠ 0 do                        ▷ We have the answer if r is 0
4:         a ← b
5:         b ← r
6:         r ← a mod b
7:     end while
8:     return b                              ▷ The gcd is b
9: end procedure
```

The text continues after the algorithm, long enough to reach a second line of this paragraph so that its spacing can be measured.

Algorithm 2 Sum of the positive entries

```
function POSITIVESUM(x_1, ..., x_n)
    s ← 0
    for i ← 1 to n do
        if x_i > 0 then
            s ← s + x_i
        else if x_i = 0 then
            skip it
        else
            count it as negative
        end if
    end for
    repeat
        s ← HALVE(s)
    until s < 1
    return s
end function
```

After both algorithms the text continues, and Algorithm 2 has no line numbers.
