1 Code

Listing 1 is set with the package's defaults, in fixed columns, and so is the inline x = f(y) in this paragraph.

Listing 1: Squares in Python.

```
def squares(n):
    # the first n squares
    return [i * i for i in range(n)]
```

The text continues after the first listing, long enough to reach a second line of this paragraph.

```
int main(void) {
    printf("hello, world\n");
    return 0;
}
```

After both listings the text continues.
